

## **1. What is 3-day immediate implant?**

The 3-day immediate implant is an innovative dental restoration procedure designed to provide patients with a rapid and effective solution for severe jaw bone deterioration. Unlike traditional implant methods that require several months for the bone to fuse, this procedure offers the remarkable advantage of completing the restoration in just three days. It allows patients to receive permanent teeth within a remarkably short timeframe.

## **2. How does a dentist perform the 3-day immediate implant?**

Dentists follow a unique protocol that involves a few key steps:

- **Single Incision:** The procedure starts with a single incision, which minimizes discomfort, bleeding, and swelling.
- **Local Anesthesia or Conscious Sedation:** Patients can opt for local anesthesia or conscious sedation, ensuring a comfortable and anxiety-free experience.
- **Implant Placement:** The dentist places implants in the harder layer of bone beyond the spongy part, which provides immediate stability for crowns and bridges.
- **No Need for Extra Surgeries:** Unlike conventional implants, there is no need for additional procedures like sinus lifts or bone grafts. The implants can be placed at an angle to avoid the sinus area, eliminating the need for extra surgeries.

## **3. What does the implant look like?**

The Swiss 3-day implant system, which is particularly suitable for individuals with low bone density, features implants that are thinner and longer than conventional ones. These implants are designed to be inserted into the stronger layer of bone beyond the spongy part, providing a solid foundation for replacement teeth.

## **4. What are the differences between 3-day immediate implants and conventional implants?**

Here are the key distinctions between the two implant methods:

<b>3-Day Immediate Implants</b>	<b>Conventional Implants</b>
<b>No Sinus Lifting or Bone Grafting</b>	Sinus Lifting and Bone grafting is required
<b>Second visit is not needed</b>	Between 3-12 month, second visit needed
<b>Permanent teeth in 3 days</b>	Permanent teeth in 3-12 month
<b>The patients who can not be treated by conventional implants can be treated equally</b>	Diabetic patients, smokers and patients with severe gum disease are <b>not</b> treated with equal success
<b>It provides immediate stability for crowns and bridges</b>	Stabilisation problems
<b>The implants are thinner and longer, they are placing the hard bone</b>	The implants are short and thick, they are placing the spongy bone

#### **5. What kind of patients can be treated with this method?**

- Patients who may face limitations with conventional implants.
- It is suitable for individuals with low bone density
- Patients who have been turned down for traditional implant treatments.
- Patients who has less teeth

#### **6. How long does the patient have to stay in Turkey?**

Patients can typically complete the entire process in just three days. Sometimes the treatment period can be longer than 3 days. It is between 3-7 days according to the treatment plan and if the patient will have teeth extraction.

#### **7. Do patients need a second visit?**

Unlike conventional implant procedures that often require a second visit, the 3-day immediate implant procedure eliminates the need for additional trips to the dentist. Patients can enjoy permanent teeth within the short span of three days, sparing them the inconvenience of extended treatment schedules.

## 8. The key benefits of having this treatment instead of conventional implants.

The benefits of choosing the 3-day immediate implant procedure over conventional implants are manifold:

- **Time Efficiency:** Patients can receive permanent teeth in just three days, compared to the months-long process of conventional implants.
- **Minimally Invasive:** The procedure is relatively pain-free, with no need for extensive incisions, stitches, or additional surgeries.
- **Suitability for Challenging Cases:** This method accommodates patients with low bone density and those who may not be suitable candidates for traditional implants.
- **Cost Savings:** Patients can save money as there is no need for temporary or intermediate dentures, additional surgeries, or time-consuming prosthetic sessions.

In conclusion, the 3-day immediate implant procedure represents a remarkable advancement in dental restoration, offering patients a swift, efficient, and cost-effective solution for severe jaw bone deterioration. Its unique advantages make it an attractive option for individuals seeking a rapid transformation in their dental health.
